

PUBLIC PRE-SALES OVERVIEW

Security, privacy and responsible use

SignalTrue provides team-level work-pattern evidence for workplace health, safety and work-design prevention. This overview gives procurement, privacy, security and worker representatives a portable summary of the current public product boundaries.

Purpose

Observe material and persistent changes in team work patterns so an organization can investigate with workers, record a proportionate control and review what happened next.

Not a conclusion

A SignalTrue observation does not establish cause, diagnose a medical condition, infer sentiment, certify compliance or replace worker consultation and professional judgement.

Core public commitments

Metadata, not content

Meeting times, durations, counts, response intervals and team mapping can be used. Message text, email bodies, documents and recordings are excluded.

Team-level reporting

Results are intended for work-system investigation. Managers do not receive employee productivity rankings or individual health-risk scores.

Minimum group protections

The reporting floor is five active people. Some sensitive indicators require eight, and a customer can configure a higher threshold.

Human decisions

Workers and accountable owners add context, decide what to change and review the evidence. SignalTrue does not close the case automatically.

Public trust centre: signaltrue.ai/trust

Data and technical boundaries

The final data flow is deployment-specific. Before production telemetry is enabled, the customer and SignalTrue confirm the purpose, scope, sources, permissions, locations, roles, retention and worker-communication requirements in writing.

Information SignalTrue may use

- Calendar event timestamps, duration, recurrence and participant counts.
- Communication timing and activity counts without message bodies or private notes.
- Mapped team membership needed to aggregate eligible work groups.
- Customer-provided context, control ownership and review dates.

Information excluded from the public product purpose

- Slack or chat message text, email bodies, document contents and meeting recordings.
- Screen, keystroke, webcam, emotion, mood or sentiment tracking.
- Individual productivity leaderboards, psychological profiles or automated employment decisions.

Technical controls described publicly

Encryption Data is encrypted in transit and at rest. Deployment-specific evidence is confirmed during security review.	Access control Role boundaries separate source configuration, evidence review, action records and executive summaries.
Aggregation Minimum group-size and data-quality checks are applied before a team-level observation is reportable.	Purpose limitation The agreed risk question, eligible teams, allowed fields, prohibited uses and output recipients are recorded before access is connected.

Deployment details that must be confirmed

- Hosting, processing, logs, backups, support access and subprocessor locations.
- OAuth scopes, connector permissions, environment separation and incident contacts.
- Retention periods, deletion workflow and contract-exit handling.
- Whether optional AI processing is enabled and which approved provider and region apply.

No storage region, certification or regulatory status should be inferred from this public overview. The signed agreement and deployment record control where details differ.

Procurement and responsible-use checklist

Use this checklist to identify the evidence your organization needs before a pilot. SignalTrue can provide deployment-specific answers and supporting material during security review.

Purpose and lawful-use record	Risk question, scope, accountable owner, intended recipients and prohibited individual-monitoring or employment-decision uses.
Data map	Sources, fields, transformations, team mapping, minimum group rules, derived metrics and report recipients.
Access matrix	Roles permitted to authorize sources, configure scope, inspect evidence, record controls or receive executive summaries.
Retention and deletion	Deployment-specific retention periods, deletion workflow, backups, support access and contract-exit process.
Hosting and subprocessors	Applicable service providers, locations, incident contacts and any optional AI-processing mode.
DPIA and DPA support	Information needed for the customer's own impact assessment, worker consultation and data-processing agreement.

Evidence-to-action method

1. Qualify Confirm coverage, group thresholds, baseline maturity and known exclusions.	2. Inspect Show current value, baseline, change, persistence, confidence and data quality.
3. Consult Let workers and managers verify context, possible causes and practical controls.	4. Review Record the owner and review date, then measure the same indicator again.
